this edited volume explores primary sexual characters in a wide variety of animal taxa it provides an overview of sexual diversity the selective pressures that have shaped it and an introduction to the data and theoretical issues in sexual selection that are changing our view of sexual processes

a critical look at evolution examines the slow process that ruled the rise and fall of the dinosaurs over hundreds of millions of years the speedy process that causes drugs to fail because a disease evolves too quickly and how human impact effects our own evolution

three emerging themes challenge the popular notion that technology advances through the efforts of a few who produce a series of revolutionary inventions that owe little or nothing to the technological past

in the last decade evolutionary psychology has come to refer exclusively to research on human mentality and behavior motivated by a nativist interpretation of how evolution operates this book encompasses the behavior and mentality of nonhuman as well as human animals and a full range of evolutionary approaches rather than a collection by and for the like minded it is a debate about how evolutionary processes have shaped cognition the debate is divided into five sections orientations on the phylogenetic ecological and psychological comparative approaches to the evolution of cognition categorization on how various animals parse their environments how they represent objects and events and the relations among them causality on whether and in what ways nonhuman animals represent cause and effect relationships consciousness on whether it makes sense to talk about the evolution of consciousness and whether the phenomenon can be investigated empirically in nonhuman animals and culture on the cognitive requirements for nongenetic transmission of information and the evolutionary consequences of such cultural exchange contributorsbernard balleine patrick bateson michael j beran m e bitterman robert boyd nicola clayton juan delius anthony dickinson robin dunbar d p griffiths bernd heinrich cecilia heyес william a hillix ludwig huber nicholas humphrey masako jitsumori louis lefebvre nicholas mackintosh euan m macphail peter richerson duane m rumbaugh sara shettleworth martina siemann kim sterelny michael tomasello laura weiser alexandra wells carolyn wilczynski david sloan wilson

this exciting new book from geoffrey hodgson is eagerly awaited by social scientists from many different backgrounds this book charts the rise fall and renewal of institutional economics in the critical analytical and readable style that hodgson s fans have come to know and love and that a new generation of readers will surely come to appreciate

one of the master naturalists of our time american scientist reveals how evolutionary theory explains and affects not just the natural world but our society and its future evolution has outgrown its original home in biology and geology the evolutionary world shows how evolution descent with modification is a concept that organizes explains and predicts a multitude of unconnected facts and phenomena adaptation plays a role not only in the development of new species but the development of human civilization by understanding how evolutionary theory has played out in areas such as our economic system our preparation for catastrophes and even the development of communities we can learn not just how these systems work but also what challenges lie ahead blind since the age of three dr geerat j vermeij has become

renowned for his unique abilities to recognize details in the natural world that other scientists would never have noticed in this book he presents a new argument for evolution s broader importance he explores similarities between genomes and languages the contrasting natural economies of islands and continents the emergence and importance of human values the long range consequences of global warming and the perils of monopoly he also shows that the lessons of evolution have implications for education our system of laws and economic growth the evolutionary world makes a fascinating argument about the broad reaching impact and importance of evolution it offers a way for us to understand and work with evolution s principles so that we can devise better solutions for our own lives society and the environment around us

historians have examined the development of surgical techniques and of the surgical profession itself but have paid scant attention to the tools that made surgery surgeon and historian kirkup honorary curator royal college of surgeons uk demonstrates how surgical instruments as sophisticated as ultrasound or lasers began as teeth mouth fists fingernails and fingers far from being a compendium drawn from instrument catalogs this volume is a masterpiece of scholarship the instruments are situated in the surgical theory and practice of their times kirkup s skill and devotion in his presentation and description raise the work from a register to a natural history of the instruments the only caveat is that some pictures are not for the squeamish an extensive bibliography and an excellent index add to the book s value

the question of why organisms reproduce sexually is still a matter of controversy in this account professor maynard smith considers the selective forces responsible for the origin and evolution of sexual reproduction and genetic recombination using quantitative population genetics arguments to support his ideas the relative importance of individual and group selection processes are also considered the aim is to give a clear statement of the theoretical issues and present enough of the evidence to show what kinds of facts are relevant it is hoped that where crucial evidence is missing experimentalists and field workers may be encouraged to collect the relevant data the author does not claim to solve all the problems he raises but this clear and well argued account should provide stimulating reading for advanced undergraduate students and research workers in evolutionary theory

is there evidence for evolution we ve all been educated about evolution about the fact that all living species have evolved from some primitive single celled life form and the theory that it happened by means of random mutations and natural selection surprisingly in this groundbreaking book dr lee spetner offers compelling evidence that the data we have supports neither the theory nor the fact of evolution instead the data actually supports an entirely different theory which if correct will have far reaching consequences for humanity and revolutionize scientific research and education this book is a must read for any thinking person from publisher s website

one of the most important aspects in biological sciences is the investigation of long term changes in nature it is commonly accepted that the universe the planetary system and all the organisms living on earth are the result of a process of continuous modification and development the architecture of recent organisms provides a key for the understanding and reconstruction of their history through the billions of years of the process called evolution evolution is the gradual change of organisms through generations and time we cannot directly observe evolution in nature so we have to reconstruct how organisms could have changed and how their variety emerged under anatomical and structural functional constraints for any evolutionary transformation it is considered that the process has to be continuous organisms are not engines which can be stopped for rebuilding organismic evolution can be likened to a gradual change in the running engine evolutionary research should not only consider obvious similarities the architectural elements by which an organism is designed are much more important in particular this means the mechanical properties of tissues their arrangement and their functional connections in german this complex of structure and function is called konstruktion or bauplan the latter term is sometimes used as a german loan word in english scientific papers and text books this approach provides new visions of biological research common knowledge of biological investigations can be integrated but in addition this approach provides answers to the question is a gradual change of one bauplan into another possible for example can a dinosaur evolve into a bird this question can be answered with a yes we can show that the dinosaur bauplan supports the possibility of this evolutionary transformation another question can a dinosaur evolve into a mammal this has to be answered with a no we can show that the bauplan does not support this kind of transformation this way of reasoning its philosophical background and the results on the reconstruction of evolutionary pathways were developed by a group of scientists in the senckenberg museum frankfurt in cooperation with several colleagues the new approach has been called the frankfurt evolutionary theory and engineering morphology in german konstruktions morphologie the results are summarized in a graphic design it is published as a poster and presented in the museum as a wall hanging in room 206 and in a modified form in room 104 of the senckenberg museum the top part of the poster shows the formation of the earth and the development of early organisms the most ancestral animals are located in the center from here the evolutionary pathways originate and branch off not all branchings of the animal kingdom can be presented in the design we decided to include those leading to well known animals or to some of specific zoological interest on these branches you find the most important steps in the evolutionary transformation of organisms represented by technical drawings at the end of each pathway a most recent or a known fossil representative is shown in a naturalistic form these stand in contrast to the model like hypothetical and technical drawings all extant animals are equally remote of their point of origin each animal by itself has attained its own stage of sophistication in the evolutionary process we no longer share the traditional anthropocentric view of the world in which man has taken the position of the top of a tree growing from so called lower to so called higher animals
