nanostructured magnetic materials there are several critical sizes that control the behavior of a magnetic material and size effects become especially critical when dimensions approach a few nanometers where quantum phenomena appear the first volume of the book nanostructured advanced magnetic materials has therefore been devoted to the recent development of nanostructured magnetic materials emphasizing size effects our understanding of magnetism has advanced with the establishment of the theory of atomic magnetic moments and itinerant magnetism simulation is a powerful tool for exploration and explanation of properties of various magnetic materials simulation also provides insight for further development of new materials naturally before any simulation can be started a model must be constructed this requires that the material be well characterized therefore the second volume characterization and simulation provides a comprehensive review of both experimental methods and simulation techniques for the characterization of magnetic materials after an introduction each section gives a detailed description of the method and the following sections provide examples and results of the method finally further development of the method will be discussed the success of each type of magnetic material depends on its properties and cost which are directly related to its fabrication process processing of a material can be critical for development of artificial materials such as multilayer films clusters etc moreover cost effective processing usually determines whether a material can be commercialized in recent years processing of materials has continuously evolved from improvement of traditional methods to more sophisticated and novel methods the objective of the third volume processing of advanced magnetic materials is to provide a comprehensive review of recent developments in processing of advanced magnetic materials each chapter will have an introduction and a section to provide a detailed description of the processing method the following sections give detailed descriptions of the processing properties and applications of the relevant materials finally the potential and limitation of the processing method will be discussed the properties of a magnetic material can be characterized by intrinsic properties such as anisotropy saturation magnetization and extrinsic properties such as coercivity the properties of a magnetic material can be affected by its chemical composition and processing route with the continuous search for new materials and invention of new processing routes magnetic properties of materials cover a wide spectrum of soft magnetic materials hard magnetic materials recording materials sensor materials and others the objective of the fourth volume properties and applications of advanced magnetic materials is to provide a comprehensive review of recent development of various magnetic materials and their applications each chapter will have an introduction of the materials and the principles of their applications the following sections give a detailed description of the processing properties and applications finally the potential and limitation of the materials will be discussed

heat transfer behavior was studied in a turbulent boundary layer with full coverage film cooling through an array of discrete holes and with injection 30 deg to the wall surface in the downstream direction stanton numbers were measured for a staggered hole pattern with pitch to diameter ratios of 5 and 10 an injection mass flux ratio range of 0.1 to 1.3 and a range of reynolds number Re_{sub} of 150 000 to 5 million air was used as the working fluid and the mainstream velocity varied from 9.8 to 34.2 m/sec 32 to 112 ft/sec the data were taken for secondary injection temperature equal to the wall temperature and also equal to the mainstream temperature the data may be used to obtain stanton number as a continuous function of the injectant temperature by use of linear superposition theory the heat transfer coefficient is defined on the basis of a mainstream to wall temperature difference this definition permits direct comparison of performance between film cooling and transpiration cooling a differential prediction method was developed to predict the film cooling data base the method utilizes a two dimensional boundary layer program with routines to model the injection process and turbulence augmentation the program marches in the streamwise direction and when a row of holes is encountered it stops and injects fluid into the boundary layer the turbulence level is modeled by algebraically augmenting the mixing length with the augmentation keyed to a penetration distance for the injected fluid ntrl site
