three speakers at the second workshop on network management and control nostalgically remembered the interop conference at which snmp was able to interface even to cd players and toasters we agreed this was indeed a major step forward in standards but wondered if anyone noticed whether the toast was burned let alone would want to eat it the assurance of the correct operation of practical systems under difficult environments emerged as the dominant theme of the workshop with growth interoperability performance and scalability as the primary sub themes perhaps this thrust is un surprising since about half the 100 or so attendees were from industry with a strong contingency of users indeed the technical program co chairs shivendra panwar of polytechnic and walter johnston of nynex took as their assignment the coverage of real problems and opportunities in industry nevertheless we take it as a real indication of progress in the field that the community is beginning to take for granted the availability of standards and even the ability to detect physical link and network level faults and is now expecting diagnostics at higher levels as well as system wide solutions

alarm management for process control elevates alarm management from a fragmented collection of procedures metrics experiences and trial and error to the level of a technology discipline it provides a complete treatment of best practices in alarm management the technology and approaches found here provide the opportunity to completely understand the what the why and the how of successful alarm systems no modern industrial enterprise particularly in such areas as chemical processing can operate without a secure and reliable infrastructure of alarms and controls they are an integral part of all production management and control systems improving alarm management is an effective way to provide operators with high value support and guidance to successfully manage industrial plant operations readers will find recommendations and guidelines are developed from fundamental concepts to provide powerful technical tools and workable approaches alarms are treated as indicators of abnormal situations not simply sensor readings that might be out of position alarm improvement is intimately linked to infrastructure management including the vital role of plant maintenance to alarm management the need to manage operators charter to continue to operate during abnormal situations vs cease operation and the importance of situation awareness without undue reliance upon alarms the ability to appreciate technical issues is important but this book requires no previous specific technical educational or experiential background the style and content are very accessible to a broad industrial audience from board operator to plant manager all critical tasks are explained with workflow processes examples and insight into what it all means alternatives are offered everywhere to enable users to tailor make solutions to their particular sites

learn how to translate an executable model of your application into running code this is not a book about theory good intentions or possible future developments you ll benefit from translation technology and solid software engineering principles that are demonstrated with concrete examples using an open source tool chain models don t deliver enough value if they are not on a direct path to code production but to waste time building models that are merely pictures of your code doesn t add much value either in this book you ll translate detailed yet platform independent models that solve real application problems using a pragmatic approach models to code quickly dives into two case studies of executable uml models the models and code are extensively annotated and illustrate key principles that are emphasized throughout the book you ll work with code production using c as the

implementation language and targeting microcomputer classprocessors this might not be your particular target language or platform but you can use you can use what you learn here to engineer or re evaluate your own code translation system to dramatically increase the value of both your modeling and code generation solution written by three leading experts models to code is an exceptional resource for producing software by model translation add it to your library today what you ll learn see how detailed models resolve ambiguity and contradiction common in requirements examine how a model can be detailed enough to be executable and testable while remaining platform independent produce code from a model leaving the model intact so it can be redeployed on new platforms or adapted to changing software and hardware technology implement platform independent model execution rules in platform specific run time code who this book is for modelers and systems engineers on active mbse projects using executable uml or not projects using simulink matlab dymola matrixx and other math modelling tools any developers with current or past model experience professors students systems engineers embedded systems developers or anyone interested in learning more about software modelling

an accessible yet rigorous and generously illustrated exploration of the computational approach to the study of biological vision seeing has puzzled scientists and philosophers for centuries and it continues to do so this new edition of a classic text offers an accessible but rigorous introduction to the computational approach to understanding biological visual systems the authors of seeing taking as their premise david marr s statement that to understand vision by studying only neurons is like trying to understand bird flight by studying only feathers make use of marr s three different levels of analysis in the study of vision the computational level the algorithmic level and the hardware implementation level each chapter applies this approach to a different topic in vision by examining the problems the visual system encounters in interpreting retinal images and the constraints available to solve these problems the algorithms that can realize the solution and the implementation of these algorithms in neurons seeing has been thoroughly updated for this edition and expanded to more than three times its original length it is designed to lead the reader

through the problems of vision from the common but mistaken idea that seeing consists just of making pictures in the brain to the minutiae of how neurons collectively encode the visual features that underpin seeing although it assumes no prior knowledge of the field some chapters present advanced material this makes it the only textbook suitable for both undergraduate and graduate students that takes a consistently computational perspective offering a firm conceptual basis for tackling the vast literature on vision it covers a wide range of topics including aftereffects the retina receptive fields object recognition brain maps bayesian perception motion color and stereopsis matlab code is available on the book s website which includes a simple demonstration of image convolution
