annotation specialist periodical reports provide systematic and detailed review coverage of progress in the major areas of chemical research written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry for over 80 years the royal society of chemistry and its predecessor the chemical society have been publishing reports charting developments in chemistry which originally took the form of annual reports however by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series specialist periodical reports was born the annual reports themselves still existed but were divided into two and subsequently three volumes covering inorganic organic and physical chemistry for more general coverage of the highlights in chemistry they remain a must since that time the spr series has altered according to the fluctuating degree of activity in various fields of chemistry some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued the current list of specialist periodical reports can be seen on the inside flap of this volume

since the discovery of quantum mechanics more than fifty years ago the theory of chemical reactivity has taken the first steps of its development the knowledge of the electronic structure and the properties of atoms and molecules is the basis for an understanding of their interactions in the elementary act of any chemical process the increasing information in this field during the last decades has stimulated the elaboration of the methods for evaluating the potential energy of the reacting systems as well as the creation of new methods for calculation of reaction probabilities or cross sections and rate constants an exact solution to these fundamental problems of theoretical chemistry based on quantum mechanics and statistical physics however is still impossible even for the simplest chemical reactions therefore different approximations have to be used in order to simplify one or the other side of the problem at present the basic approach in the theory of chemical reactivity consists in separating the motions of electrons and nuclei by making use of the born oppenheimer adiabatic approximation to obtain electronic energy as an effective potential for nuclear motion if the potential energy surface is known one can calculate in principle the reaction probability for any given initial state of the system the reaction rate is then obtained as an average of the reaction probabilities over all possible initial states of the reacting articles in the different stages of this calculational scheme additional approximations are usually introduced

for the first time the discipline of modern inorganic chemistry has been systematized according to a plan constructed by a council of editorial advisors and consultants among them three nobel laureates e o fischer h taube and g wilkinson rather than producing a collection of unrelated review articles the series creates a framework which reflects the creative potential of this scientific discipline thus it stimulates future development by identifying areas which are fruitful for further research the work is indexed in a unique way by a structured system which maximizes its usefulness to the reader it augments the organization of the work by providing additional routes of access for specific compounds reactions and other topics
