this book describes in detail regarding radiological clinical and histopathological signs in pulmonology this book is one stop solution for all those interested in pulmonology and its classic signs

this volume gathers together all the lectures presented at the 6th ieee mediterranean conference it focuses on the mathematical aspects in the theory and practice of control and systems including stability and stabilizability robust control adaptive control robotics and manufacturing these topics are under intense investigation and development in the engineering and mathematics communities the volume should have immediate appeal for a large group of engineers and mathematicians who are interested in very abstract as well as very concrete aspects of control and system theory

this book grew out of courses which i taught at cornell university and the university of warwick during 1969 and 1970 i wrote it because of a strong belief that there should be readily available a semi historical and geo metrically motivated exposition of j h c whitehead s beautiful theory of simple homotopy types that the best way to understand this theory is to know how and why it was built this belief is buttressed by the fact that the major uses of and advances in the theory in recent times for example the s cobordism theorem discussed in 25 the use of the theory in surgery its extension to non compact complexes discussed at the end of 6 and the proof of topological invariance given in the appendix have come from just such an understanding a second reason for writing the book is pedagogical this is an excellent subject for a topology student to grow up on the interplay between geometry and algebra in topology each enriching the

other is beautifully illustrated in simple homotopy theory the subject is accessible as in the courses mentioned at the outset to students who have had a good one semester course in algebraic topology i have tried to write proofs which meet the needs of such students when a proof was omitted and left as an exercise it was done with the welfare of the student in mind he should do such exercises zealously

for nonparametric statistics the last half of this century was the time when rank based methods originated were vigorously developed reached maturity and received wide recognition the rank based approach in statistics consists in ranking the observed values and using only the ranks rather than the original numerical data in fitting relationships to observed data the ranks of residuals from the fitted dependence are used the signed based approach is based on the assumption that random errors take positive or negative values with equal probabilities under this assumption the sign procedures are distribution free these procedures are robust to violations of model assumptions for instance to even a considerable number of gross errors in observations in addition sign procedures have fairly high relative asymptotic efficiency in spite of the obvious loss of information incurred by the use of signs instead of the corresponding numerical values in this work sign based methods in the framework of linear models are developed in the first part of the book there are linear and factor models involving independent observations in the second part linear models of time series primarily autoregressive models are considered
